## PENNSYLVANIA SALES TAX

Residents of Pennsylvania are subject to 3% sales tax on stock purchased from our Nursery, except on stock which is purchased for resale in its original form or for horticultural production (Christmas trees and ornamentals) in which case it will be necessary that this Sales Tax Exemption be completed and mailed with your order.

Out-of-State purchasers taking delivery at our Nursery are also subject to 3% sales tax, but have the same benefit of exemptions as Pennsylvania residents. Out-of-State purchasers ordering stock for shipment and delivery by common carrier are not subject to this sales tax.

## **EXEMPTION CERTIFICATE**

**Commonwealth of Pennsylvania Sales and Use Tax Act No. 381,  
Effective March 7, 1956**

## PLANTING SEASON AND TREE SPACING

In this part of the country, most planting should be done as early as possible, April 1 to May 15 being the usual planting season. Fall planting (Sept. 1 to Oct. 15) can also be done if weather is favorable. The spacings commonly used are 5 x 5 feet for Christmas tree plantings and 6 x 6 feet and wider for timber plantings. The 5 x 5 spacing requires 1740 trees per acre and the 6 x 6 spacing requires 1210. The land to be planted should be free of heavy brush. Additional expense is not necessary as weeds and light sod give shade and moisture protection for the first few years after planting.

## CARE OF TREES AFTER ARRIVAL

When the planting stock is received, it should be kept cool and moist until planted. If planting cannot be done in a day or two after the stock is received, it should be "heeled in." This consists of digging a small trench wide enough and deep enough to accommodate the roots of the stock. Loosen the bundles and spread out slightly in the trench so that soil will cover all roots. After the soil is put back in the trench over the roots, pack firmly with the foot. Then water stock. With such care, the stock should keep well in this condition for a week or longer until planted.

## PLANTING METHODS

A light mattock is a good planting tool. A hole big enough for the tree is dug by one man. Another follows closely behind with a bucket of trees. The trees are kept in a soupy mud in the bucket until removed and placed in the prepared hole. Roots should be spread out in the hole as much as possible, soil returned to the hole and firmly packed with the foot or heel. At no time should the roots be permitted to dry out.

Where the soil is not too stony, sod is very light, and the stock to be planted is small (2 and 3 year seedlings), the "slit" method of planting is also used. A straight spade or planting bar instead of the mattock is used, and a slit 5-7" deep is made in the soil. While the spade or bar is still in the ground and held to one side of the slit, the second man with the bucket of trees places a tree in the open slit. The spade or bar is then removed and the man operating the spade closes the slit tightly with one or two heavy thrusts of the heel to one side of the slit. The tree should be planted slightly deeper than it was in the seedbed or transplant row.

## **Kind of Trees to Plant**

Scotch Pine has been one of the most popular and successful species for Christmas tree planting in northwestern Pennsylvania. Its shape and color, rapid growth, response to shearing, and retention of needles has made it a favorite among Christmas tree growers. Salable Christmas trees can be obtained from Scotch Pine plantations within 6 to 8 years following planting. Austrian Pine and Red Pine also make good Christmas trees. The Spruces and Firs are in good demand for Christmas trees, but they usually require a longer growing period (3 to 4 years) than the pines before reaching the salable size.

White and Red Pine, and Larch are good species to plant for timber purposes.

## **Shearing Christmas Trees**

Shearing a Christmas tree plantation about the third or fourth year after planting will greatly improve the quality of the trees. Occasionally a second or even a third shearing is necessary to produce top quality trees. The shearing, using a light pair of hedge shears, is done in June for the Pines and in July for the Spruces. Part of the latest growth on the tips of the side branches is cut off and the terminal growth of fast growing Pines should also be cut back. Long and unshapely branches can be trimmed at this time to improve the tree shape. The shearing operation tends to improve the shape of the tree and give it more compact foliage.
